On behalf of the American Academy of Family Physicians (AAFP), which represents 129,000 family physicians and medical students across the country, thank you for the opportunity to submit testimony for the record to the US House Energy and Commerce Committee Health Subcommittee regarding the continuation of the Children's Health Insurance Program (CHIP).

### **Congress Should Swiftly Approve a Long-Term Extension of CHIP Funding.**

The AAFP urges Congress to swiftly approve a bipartisan long-term extension of CHIP, in order to promote stability and health security for 8.9 million low-income children<sup>1</sup> and their families. Time is of the essence in completing this work in order to ensure continuous access to primary and preventive services for this vulnerable population, protect progress in public health and allow States to adequately plan.

The AAFP has supported CHIP since its inception in 1997, and during each subsequent reauthorization and extension of funding (2007, 2009, and 2015), as a way to extend health coverage to uninsured children whose families do not meet eligibility requirements for Medicaid. Since the enactment of the *Medicare Access and CHIP Reauthorization Act of 2015* (MACRA), in April 2015, the AAFP has reiterated support for CHIP funding beyond the current end-date of September 30, 2017—through letters to this Committee and to Congressional Leadership. As a medical specialty, family medicine is committed to the success of all health insurance programs financed with public dollars, including CHIP. AAFP [member data](#) indicates that over two thirds of AAFP members accept new Medicaid patients.<sup>2</sup> Although the AAFP does not collect member survey data on CHIP participation, we know (due to the close connection between Medicaid and CHIP—including the fact that some states operate combined Medicaid / CHIP programs—and the fact that family physicians perform so many pediatric services) that family physicians are helping to carry out Congress's intent behind CHIP: treating low-income children, many of whom would be uninsured without the program.

Family physicians play an important role in addressing American children's health needs. According to the AAFP's [latest member census](#), published December 31, 2016, over 80 percent of AAFP members care for adolescents, and 73 percent care for infants and children.<sup>3</sup> Other AAFP [member survey data](#) reflect that about 20 percent of AAFP's members deliver babies as part of their practice, with roughly 6 percent delivering more than 30 babies in a recent calendar year.<sup>4</sup> Of AAFP active members with full hospital

privileges, 70 percent provide newborn care in the hospital, and 64 percent provide pediatric care in the hospital.<sup>5</sup> This is consistent with family medicine’s traditional role of practicing in the entire scope of the physician license in order to meet the needs of the community in which the family physician practices. A family physician who serves a small rural community without a pediatrician, for example, will often perform most or all pediatric care for that community.

The AAFP also supports health care for all, consistent with the public-health mission of the specialty of family medicine. The AAFP promotes [health care for all](#) in the form of “a primary care benefit design featuring the patient-centered medical home, and a payment system to support it,” for everyone in the United States.<sup>6</sup> AAFP believes that all Americans should have access to primary-care services (e.g. in the case of infants and children, immunizations and other evidence-based preventive services, prenatal care, and well-child care), without patient cost sharing. The AAFP believes that universal health care also should include services outside the medical home (e.g. hospitalizations) with reasonable and appropriate cost sharing allowed, but with protections from financial hardship. Supporting universal access to care is also consistent with the “triple aim” of improving patient experience, improving population health, and lowering the total cost of health care in the United States. Having both health insurance and a usual source of care (e.g., through an ongoing relationship with a family physician) contributes to better health outcomes, reduced disparities along socioeconomic lines, and reduced costs.<sup>7</sup>

The AAFP urges Congress to pass a “clean” extension of CHIP with a minimum of unnecessary policy changes. Family physicians and their practices thrive on stability in the insurance market. Unlike Medicare and Medicaid, which provide stable and reliable federal funding under current law, CHIP funding is contingent upon Congressional action at regular intervals. Given the importance of the program to almost 9 million children from low-income families, the AAFP urges the Committee to swiftly extend and stabilize the program on a long-term basis.

## **Congress Should Also Provide Long-Term Support for Graduate Medical Education Through Continued Funding of the Teaching Health Center Program and Community Health Centers.**

As an additional note, the AAFP would like to emphasize to the Committee the importance of providing long-term support for the Teaching Health Center Graduate Medical Education (THCGME) program, which will also expire on September 30, 2017, absent Congressional intervention. THCGME is a successful primary-care training program, currently financing training for 742 medical and dental residents in community-based ambulatory settings. Residents in the THCGME program train exclusively in primary-care specialties.

Of relevance to the legislative process surrounding CHIP, two-thirds of the THCGME residents are training in family medicine or pediatrics.<sup>8</sup> The THCGME program, administered by the Health Resources and Services Administration (HRSA), accounts for less than one percent of the annual federal spending devoted to graduate medical education, yet it is the only GME program that is devoted entirely to training primary-care physicians and dentists. Residents in the program train in community health centers (including federally qualified health centers), and tend to be concentrated in rural and underserved areas that need access to more providers, particularly primary-care physicians. American Medical Association Physician Masterfile data confirms that a majority of family medicine residents practice within 100 miles of their residency training location.<sup>9</sup> By comparison, fewer than 5 percent of physicians who complete training in hospital-based GME programs provide direct patient care in rural areas.<sup>10</sup> Thus, the most effective way to encourage family and other primary-care physicians to practice in rural and underserved areas is not to recruit them from remote academic medical centers but instead to train them in these underserved areas.

Community health centers (CHCs) play an important role in primary care graduate medical education as well. The nation's 9,800 centers provide care for 25 million patients, 71 percent of whom are low-income.<sup>11</sup> CHC facilities, along with other safety

net providers, are valuable training settings for THCGME residents who care for patients like those they are likely to treat in primary care outpatient settings. Residents who train in CHCs also have the unique opportunity to be trained in delivery system models using electronic health records, providing culturally competent care, and following care coordination protocols.<sup>12</sup> Some are also able to operate in environments where they are trained in mental health, drug and substance use treatment, and chronic pain management.<sup>13</sup> We know that residents who train in underserved communities are likely to continue practicing in those same environments.<sup>14</sup>
