Recommended Curriculum Guidelines for Family Medicine Residents

Care of Older Adults

This document was endorsed by the American Academy of Family Physicians (AAFP).

Introduction

This Curriculum Guideline defines a recommended training strategy for family medicine residents. Attitudes, behaviors, knowledge, and skills that are critical to family medicine should be attained through longitudinal experience that promotes educational competencies defined by the Accreditation Council for Graduate Medical Education (ACGME), www.acgme.org. The family medicine curriculum must include structured experience in several specified areas. Much of the resident’s knowledge will be gained by caring for ambulatory patients who visit the family medicine center, although additional experience gained in various other settings (e.g., an inpatient setting, a patient’s home, a long-term care facility, the emergency department, the community) is critical for well-rounded residency training. The residents should be able to develop a skillset and apply their skills appropriately to all patient care settings.

Structured didactic lectures, conferences, journal clubs, and workshops must be included in the curriculum to supplement experiential learning, with an emphasis on outcomes-oriented, evidence-based studies that delineate common diseases affecting patients of all ages. Patient-centered care, and targeted techniques of health promotion and disease prevention are hallmarks of family medicine and should be integrated in all settings. Appropriate referral patterns, transitions of care, and the provision of cost-effective care should also be part of the curriculum.

Program requirements specific to family medicine residencies may be found on the ACGME website. Current AAFP Curriculum Guidelines may be found online at www.aafp.org/cg. These guidelines are periodically updated and endorsed by the AAFP and, in many instances, other specialty societies, as indicated on each guideline.
Each residency program is responsible for its own curriculum. This guideline provides a useful strategy to help residency programs form their curricula for educating family physicians.

Preamble

The percentage and number of older adults in the population continues to increase in the United States and throughout the world. Older adults occupy a large number of acute care hospital beds, are the largest percentage of nursing home residents, and make more visits to physicians’ offices than any other segment of the population. The acquisition of age-appropriate skills and knowledge in taking an older adult patient’s history, performing a physical examination, making clinical and psychosocial diagnoses, and managing a patient’s condition must be an integral part of residency training. As the U.S. health care system continues to evolve, we will need to develop better strategies for providing quality care to this complex segment of the population while framing care of older adults with attention to patient-specific goals of care and multimorbidity.

There are many subtle, yet significant, differences in the diagnosis and management of older adults when compared with younger patients. The philosophy of providing comprehensive, continuous care includes the belief that a patient’s health in later years is vitally affected by lifestyle and health care patterns established earlier in life. Family physicians play a critical role in promoting health maintenance and optimizing chronic disease management as patients age. They also play an integral role in helping older adults maintain physical function and independence for as long as possible. Family medicine residents must gain skill in helping older adults develop appropriate goals of care and competence in developing patient-specific plans of care for older adults across care settings. This curriculum applies a comprehensive approach to the psychosocial and economic factors affecting aging patients and their families.

Competencies

At the completion of residency training, a family medicine resident should be able to:

- Perform comprehensive, standardized geriatric assessments and develop patient-specific treatment plans that incorporate the patient’s goals of care, optimize function, and alleviate symptoms (Patient Care, Medical Knowledge)
- Optimize treatment plans based on knowledge of local geriatric care resources, including local, state, and federal agencies (Systems-based Practice, Practice-based Learning and Improvement)
- Lead coordination of care for older adults across ambulatory, inpatient, and institutional care settings and across health care providers, institutions, and governmental agencies (Systems-based Practice)
• Demonstrate the ability to communicate effectively with the patient, as well as the
  patient’s family and caregivers, to ensure the treatment plan is developed
  collaboratively and is clearly understood (Interpersonal and Communication Skills)
• Recognize practice limitations and seek consultation with other health care
  professionals when necessary to provide optimal care for older adults (Patient Care)

Attitudes

The resident should demonstrate attitudes that encompass:

• Awareness of the effects that attitudes and stereotypes related to aging, disability,
  and death can have on the care of older adults
• Empathy and compassion for older adults and their families/caregivers when helping
  them cope with inevitable decline and loss
• Promotion of the patient’s dignity through self-care and self-determination
• Recognition of the importance of family, home, and other social constructs in the
  overall lifestyle and health of patients
• Understanding of appropriate limitation of investigation and treatment for the benefit
  of the patient
• Awareness of the importance of a multidisciplinary approach to the enhancement of
  individualized, comprehensive care for older adults
• Accessibility to and accountability for his or her patients and their families/caregivers
• Awareness of the need to consider resources and related limitations when
  developing patient-specific treatment plans for older adults
• Awareness of the benefits, limitations, and appropriate use of advance directives,
  living wills, durable powers of attorney, and, where enacted by state statute,
  Physician Orders for Life-Sustaining Treatment

Knowledge

In the appropriate setting, the resident should demonstrate the ability to apply
knowledge of:

1. Normal physiologic changes that are associated with aging
   a. Diminished homeostatic abilities
   b. Altered metabolism and effects of drugs
   c. Physiology of aging in various organ systems

2. Normal psychological, social, and environmental changes of aging
a. Reactions to common stressors, including retirement, bereavement, relocation, illness, and natural decline in physical and cognitive abilities
b. Changes in family and socioeconomic parameters that affect health

3. Unique modes of presentation for care, including atypical presentations of specific diseases in older adult patients

4. Risks points and adverse outcomes in geriatric care
   a. Polypharmacy
   b. Transitions of care
   c. Nonrecognition of treatable illness
   d. Iatrogenic illness
   e. Treatment that does not take into account goals of care
   f. Functional impairment, immobilization, and associated consequences
   g. Cognitive impairment and associated consequences
   h. Inappropriate institutionalization
   i. Unsupported family/caregivers

5. Promotion of health maintenance through patient- and age-appropriate screening and risk factor assessment

6. Promotion of health in older adults through exercise, nutrition, and behavioral or lifestyle counseling

7. Services available to promote rehabilitation or maintenance of physical independence of older adults, thus increasing their ability to function in their existing family, home, and social environments

8. Community resources, including those used to help patients maintain independence

9. Indications for and benefits of the house call in the assessment and management of older adults

10. Characteristics of various types of housing alternatives and long-term care spaces available to the older adults, including independent living, personal care homes, assisted living, skilled nursing home care, and custodial nursing homes

11. Financial aspects of health care, with understanding of Medicare, Medicaid, and how various types of housing and long-term care housing options are financed

12. Recognition and management of elder abuse and neglect

13. Evaluation of the functional status of older adults
14. Evaluation of the cognitive status of older adults

15. Care of conditions that are common in older adults, can impose significant burden, or differ in presentation and/or management in older adults

   a. Sensory: hearing and vision loss, speech disorders, changes in taste, vestibular dysfunction, altered proprioception

   b. Respiratory: chronic obstructive pulmonary disorder (COPD), pneumonia (infectious or aspiration), other respiratory infections, obstructive sleep apnea (OSA)

   c. Cardiovascular: hypertension, congestive heart failure, myocardial infarction, valvular heart disease, thromboembolism, temporal arteritis, cerebral vascular accident, transient ischemic attacks, syncope, postural hypotension

   d. Oral conditions: caries, periodontal disease, tooth loss and denture care, xerostomia, oral-pharyngeal cancers, oral-systemic linkages

   e. Gastrointestinal: dentition problems, dysphagia, abdominal pain, constipation, fecal impaction

   f. Genitourinary: incontinence, urinary tract infections, bacteriuria, sexual dysfunction, prostate disease

   g. Musculoskeletal: degenerative joint disease, osteopenia/osteoporosis, fractures, contractures, rheumatologic disease, podiatric problems, falls

   h. Neurological: pain, mild cognitive impairment, memory loss, delirium, dementia, altered mental status, dizziness, tremor, gait dysfunction, sleep disturbance

   i. Metabolic: dehydration, diabetes, hypothyroidism, medication-induced illness, malnutrition, anemia, hypothermia, malignancies, failure to thrive

   j. Psychosocial: anxiety, depression, psychological effects of illness, alcoholism and other substance abuse, grief reactions, abuse (physical, financial, and psychological), end-of-life care

   k. Dermatologic: xerosis, cutaneous neoplasms, environmental and traumatic lesions including skin tears and pressure ulcers, wounds, skin manifestations of systemic illness

**Skills**

In the appropriate setting, the resident should demonstrate the ability to independently perform or appropriately refer the following skills:

1. Basic elements of geriatric assessment, including the standardized methods for assessing physical, cognitive, emotional, and social functioning, as appropriate
2. Screening examinations for mental status, depression, and functional status, including activities of daily living (ADL) and instrumental activities of daily living (IADL)

3. Physical diagnosis, including:
   a. Mobility, gait, and balance assessments
   b. Recognition of normal and abnormal signs of aging
   c. Preoperative assessment
   d. Comprehensive history and mental status examination, utilizing all available sources of information
   e. Evaluation of the appropriate use of assistive devices (e.g., cane, walker, wheelchair, power chair)

4. Efficient and comprehensive physical examination in the following venues: office, hospital, and nursing home settings

5. Appropriate selection, performance, and interpretation of diagnostic procedures in older adults

6. Comprehensive medication review, and prescription of appropriate medications and dosages, with consideration of age-related physiology, side effects in light of the patient’s comorbidities, functional status, other medications, and drug-drug interactions

7. Appropriate house calls and coordination of home care services

8. Development of problem lists in practical, clinical, functional, psychological, and social terms

9. Integration of factors of the patient’s family life, home life, and general lifestyle into the diagnostic and therapeutic process

10. Establishment of appropriate priorities and limitations for investigation and treatment

11. Communication with the patient and/or caregivers about the proposed investigation and treatment plans in a way that promotes understanding, adherence, and appropriate attitudes

12. Provision of counseling for patients about age-related psychological, social, and physical stresses, and normal life cycle changes, including aging and death

13. Coordination across disciplines of a range of services appropriate to the patient’s needs and support systems

14. Participation with an interdisciplinary team in transitions of care to ensure that accurate data (e.g., acute events, medical history, medications, allergies, baseline
cognitive and functional status, advance care plan, responsible physician) are well documented, that the patient and/or family understand the plan of care, and that the follow-up plan is clearly outlined.

15. Attendance to patient safety concerns (e.g., fall risk, hydration, nutrition, bladder and bowel function, skin integrity, inappropriate medications) in the assessment and management of older adults across care settings.

16. In patients with life-limiting or advanced chronic illness, assessment for symptoms (e.g., pain, dyspnea, nausea, vomiting, fatigue, constipation) at regular intervals and institution of appropriate treatment based on goals of care.

Implementation

This curriculum should be taught during both focused and longitudinal experiences throughout the residency program. Physicians who have demonstrated skill and compassion in caring for older adults and who have a positive attitude toward older adults should be available to act as role models to the residents and should be available to provide education and support to residents who are managing their own older adult patients. A multidisciplinary approach coordinated by the family physician is an appropriate method for structuring teaching experiences. Individual teaching and small group discussion will help promote appropriate attitudes.

The resident should be responsible for caring for older adults across care settings and have opportunities to act as decision maker, counselor, and case manager. Each family medicine resident’s panel of patients should allow for exposure to a variety of patients, including healthy, community-dwelling older adults; older adults suffering from chronic illness; acutely ill and/or hospitalized older adults; and patients at the end of life. The resident should be required to have experiences providing continuing care for older adult patients in the ambulatory setting, the home, and the hospital, and in long-term care.
