Joint Principles for the Medical Education of Physicians as Preparation for Practice in the Patient-Centered Medical Home
December 2010

INTRODUCTION

The Patient-Centered Medical Home (PCMH) is an approach to providing comprehensive, continuous healthcare that is based on the foundation of a healing personal relationship between a patient, their physician, and members of a proactive, collaborative care team. Care provided through a PCMH is facilitated through partnerships between these individuals and the patients' families. Since the original adoption of the Joint Principles of the Patient Centered Medical Home in February 2007, it has been recognized that a remaining need exists for a similar set of principles to guide the education of medical students, in order to provide a foundation in primary care medicine and PCMH relevant for <u>all</u> students, irrespective of their eventual specialty choice.

In June 2010, representatives from the AAFP, AAP, ACP and AOA (the original organizations that ratified the Joint Principles of the PCMH) re-engaged to create the following principles to guide the education of physicians who graduate from medical schools within the United States. While similar principles can, and should, be applied to other health professions students, it was the specific charge of this committee to create training principles for physician education.

A matrix was created to support the cross-walk among the original Joint Principles of the PCMH, the attributes and competencies needed to address them, and the corresponding educational sub-principles to support each one. In addition, each educational sub-principle was linked with the pertinent ACGME/ABMS core competencies of medical education. [Appendix A]

PRINCIPLES OF THE PATIENT CENTERED MEDICAL HOME

Personal physician - Each patient has an ongoing relationship with a personal physician trained to provide first contact, continuous and comprehensive care.

    <u>Attributes/Competencies Needed</u>
    Medical students should demonstrate knowledge about the definition of patient-centeredness and must be able to demonstrate the ability to provide patient centered care in their clinical encounters.

    <u>Corresponding Educational Sub-Principles</u>

47 Medical students are expected to:
48   1. experience continuity in relationships with patient(s) in a
49   longitudinal fashion within practices that deliver first-contact,
50   comprehensive, integrated, coordinated, high-quality and affordable
51   care.
52   2. communicate effectively and demonstrate caring and respectful
53   behaviors when interacting with patients and their families and
54   fellow professionals.
55
56 *Physician directed medical practice* - The personal physician leads a team of
57 individuals at the practice level who collectively take responsibility for the ongoing
58 care of patients.
59
60   Attributes/Competencies Needed
61   Medical students should be able to demonstrate collaborative care via
62   leadership skills that result in effective information exchange and teaming
63   with patients, their patients' families, and professional associates.
64
65   Corresponding Educational Sub-Principles
66   Medical students are expected to:
67   1. work effectively with others as a member or leader of a health care
68   team or other professional group via interdisciplinary team
69   experiences (i.e. those involving nurses, social worker, case
70   managers, mental health professionals, diabetes educators,
71   community partners, pharmacists, etc).
72   2. articulate the roles, functions and working relationships of all
73   members of the team.
74   3. apply knowledge of leadership development, quality improvement,
75   change management and conflict management.
76
77 *Whole-person orientation* - The personal physician is responsible for providing for
78 all the patient's health care needs or taking responsibility for appropriately
79 arranging care with other qualified professionals. This includes for all stages of
80 life: acute care; chronic care; preventive services; and end-of-life care.
81
82   Attributes/Competencies Needed
83   Medical students should be able to provide patient care that is
84   compassionate, coordinated, appropriate, and effective for the treatment
85   of health problems and the promotion of health.
86
87   Corresponding Educational Sub-Principles
88   Medical students are expected to:
89   1. demonstrate knowledge and an appreciation of life cycle concepts.
90   2. practice motivational interviewing and utilization of other tools to
91   promote patient and family engagement and health behavior
92   change.

93 3. promote patient and family self-efficacy and shared decision-
94   making.
95 4. experience partnerships with health coaches and care coordinators
96   who care for patients with complex conditions.
97 5. demonstrate sensitivity and responsiveness to patients' culture,
98   age, gender and disabilities via opportunities to elicit from patients
99   and/or their families their cultural, spiritual, and ethical values and
100   practices.
101 6. understand the importance of health literacy and its impact on
102   patient care and outcomes; utilize effective listening and other skills
103   in the assessment of health literacy.
104 7. describe and discuss strategies needed to address patient
105   transition(s) of care.
106
107 *Care is coordinated and/or integrated* across all elements of the complex health
108 system (e.g. subspecialty care, hospitals, home health agencies, nursing homes)
109 and the patient's community (e.g. family, public and private community based
110 services). Care is facilitated by registries, information technology, health
111 information exchange and other means to assure that patients get the indicated
112 care when and where they need and want it, in a culturally and linguistically
113 appropriate manner.
114
115   Attributes/Competencies Needed
116   Medical students should be able to demonstrate an awareness of and
117   responsiveness to the larger context and system of health care and the
118   ability to effectively call on system resources to provide care that is of
119   optimal value.
120
121   Corresponding Educational Sub-Principles
122   Medical students are expected to:
123   1. know how the economics of health care systems across a
124   community, including all settings of care, affect patient care and
125   outcomes.
126   2. apply knowledge of the relationship between payment models and
127   health care delivery models.
128   3. experience the use of electronic health records, e-visits, e-
129   prescribing and electronic billing.
130   4. learn the basics of medical informatics and the technologies that
131   support care coordination, population health management, quality
132   management, care management and decision support.
133   5. understand basic principles of population health, including how
134   patient registries can be used to manage population health
135   6. use information technology to manage information, access on-line
136   medical information; and support their own education.
137   7. know and apply the principles of patient safety.
138   8. assess and recommend solutions to address patient risk during
139   transitions of care including use of tools such as care plans.

140   9. demonstrate knowledge of community resources and the
141   importance of working with non-physician partners
142   10. understand how to collaborate with specialists from various
143   disciplines to provide patient-focused co-management of care over
144   time.
145

146 *Quality and safety are hallmarks* of the medical home:
147 – Advocacy for attainment of optimal, patient centered outcomes defined by
148   collaborative care planning process
149 – Evidence based medicine and clinical decision support tools guide decision
150   making
151 – Physicians accept accountability for quality improvement (QI) through
152   voluntary engagement in performance measurement and improvement
153 – Patients actively participate in decision making and patient feedback is sought
154   to assure expectations are being met
155 – HIT is used to support optimal patient care performance measurement,
156   patient education and enhanced communication
157 – Practices go through a voluntary recognition process to demonstrate that they
158   have PCMH capabilities
159 – Patients and families participate in quality improvement activities at the
160   practice level
161

162   Attributes/Competencies Needed
163   Medical students should be able to use of point-of-care evidence-based
164   clinical decision support and know principles of performance improvement,
165   measurement and how to use information to make decisions within
166   practice via interpretation of quality reports, patient and family
167   engagement, self-assessment of one's own performance, knowledge of
168   the principles of community health assessment and awareness of the
169   need for patient and family advocacy skills.
170

171   Corresponding Educational Sub-Principles
172   Medical students are expected to:
173   1. understand evidence-based medicine as the standard of care.
174   2. participate in teams within practices as they develop a culture of
175   learning to improve the care process and patient experience.
176   3. learn how health care is operationalized outside of the hospital
177   setting.
178   4. participate in multi-disciplinary patient safety training experiences.
179   5. engage in opportunities to review quality data and recommend
180   evidence-based systems changes to respond to performance
181   measurement.
182

183 *Enhanced Access* to care is available through systems such as open-access
184 scheduling, extended hours, and new options for communications between
185 patients, their personal physician and practice staff.
186

187   <u>Attributes/Competencies Needed</u>
188   Medical students should be able to demonstrate knowledge about the
189   rationale and principles of enhanced access and practice the use of non-
190   traditional encounter types including telephone medicine, E-visit care,
191   group visits, visits with non-physician providers, and care outside of the
192   location of the physical practice.
193
194   <u>Corresponding Educational Sub-Principles</u>
195   Medical students are expected to:
196   1. experience a variety of different encounter types such as face-to-
197   face, telephone and electronic messaging, home-based care and
198   group visits.
199   2. use information technology to support patient care decisions and
200   patient education.
201   3. apply knowledge of care partnership support and demonstrate
202   understanding of the role of that support in addressing patient
203   access and communication related to roles/responsibilities,
204   appointments, emergency/urgent situations, etc.
205
206 *Payment* appropriately recognizes the added value provided to patients who
207 have a PCMH.
208 – Recognizes and values work that is done outside of face-to-face visit
209 – Pays for care coordination, ancillary providers and community resources
210 – Supports adoption of HIT for quality improvement
211 – Supports provision of e-communication
212 – Recognizes values of physician work associated with remote monitoring of
213   clinical data using technology
214 – Maintains fee-for-service (FFS)
215 – Recognizes case mix differences
216 – Allows shared savings from reduced hospitalizations
217 – Allows for quality bonus or incentive payments for measurable improvement
218
219   <u>Attributes/Competencies Needed</u>
220   Medical students should demonstrate knowledge of the elements of
221   population-based care, non-visit work, and have an appreciation of the
222   value of these aspects of care through an understanding of enhanced
223   payment opportunities and both an understanding and capacity to apply
224   the principles of advocacy and effective negotiation.
225
226   <u>Corresponding Educational Sub-Principles</u>
227   Medical students are expected to:
228   1. know various physician payment methodologies (including those
229   encompassing of past, current and future policies).
230   2. assist patients in dealing with system complexities via advocacy
231   and negotiation

3. be informed of the public and private policy development processes that establish and/or influence coverage and payment determinations.
4. understand the importance of effectively advancing those policies that are in the best interests of their patients and the nation's health care system.
5. be familiar with current data on the overall cost of health care including an understanding of the proportion of health care dollars spent on various segments of the health care system, those costs incurred by patients, as well as the overall costs of health care for employers and the government.

RESOURCES

Adding these components to undergraduate education in a cohesive manner will also require additional resources. Some of the sub-principles can be implemented by adding students into already existing patient-care and practice-based activities. However, in other cases, it will be necessary to dedicate faculty and staff to create and oversee new experiences for the students. This may require including disciplines that have not traditionally taught medical students, including faculty with expertise in economics, health policy, or business administration. Additionally, it may be necessary to find ways to better assist and compensate community-based ambulatory practices for taking on students. Finally, resources may be needed for infrastructure development to provide students with the necessary tools, including access to electronic health records, registries, and quality improvement tools, to experience some of the systems-based aspects of the PCMH.

UNMET NEEDS

Professional development to prepare faculty for health reform changes is a prerequisite to training medical students in both primary and specialty care. It is recognized that resident physicians will also be integral components of medical student education in PCMH concepts. Faculty development is a current ***unmet need*** of this generation of faculty members with respect to how to teach medical students and residents about the PCMH.

The current educational system lacks the necessary tools for the evaluation and the assessment of learners with regard to the education of medical students and residents in the principles and attributes/competencies of the PCMH.

There is an urgent need for demonstration projects that will inform both methods of faculty development as well as the development of assessment tools and outcomes measures.

BACKGROUND OF THE MEDICAL HOME CONCEPT

278
279 The American Academy of Pediatrics (AAP) introduced the medical home
280 concept in 1967, initially referring to a central location for archiving a child's
281 medical record. In its 2002 policy statement, the AAP expanded the medical
282 home concept to include these operational characteristics: accessible,
283 continuous, comprehensive, family-centered, coordinated, compassionate, and
284 culturally effective care.
285
286 The American Academy of Family Physicians (AAFP) and the American College
287 of Physicians (ACP) have since developed their own models for improving
288 patient care called the "medical home" (AAFP, 2004) or "advanced medical
289 home" (ACP, 2006).
290

WORKING GROUP CONTRIBUTORS

291
292
293 Members of the working group who volunteered their time and expertise to
294 prepare this document are listed in Appendix B.

316   **Appendix A**

317   **Joint Principles Mapping Grid for Educational Sub-principles Development Project**

318   **July 2010**

319

320   **Column 1** – Existing Joint Principles of the Patient Centered Medical Home

321   **Column 2** – Attributes/competencies needed by physicians for medical home practice. Listed are a few examples – this will be developed by working group

322   members based on their knowledge and experience in the PCMH module and the relevant literature provided.

323   **Column 3** – This is intended for listing key concepts that the working group desires to have included in the language of the educational sub-principles

324   **Column 4** – This is intended to cross walk the educational sub-principles to the core competencies.

325

Joint Principle of the PCMH	Attributes/Competencies Needed	Corresponding Educational Sub-principle	Crosswalk to Core Competencies Key: PC = Patient Care; MK= Medical Knowledge; IC= Interpersonal & Communication Skills; P= Professionalism; PBL= Practice-based Learning & Improvement; SBP= Systems-based Practice
Personal physician. Each patient has an ongoing relationship with a personal physician trained to provide first contact, continuous and comprehensive care	• *Defining and demonstrating patient-centeredness in their clinical encounters* • *Demonstrating enhanced, timely, multi-modal communications between the practice and patients/families to assure continuous care* • *Including patients/families as advisors to the medical home, eliciting input and feedback on a continuous basis*	• *Curriculum should provide students with longitudinal experience(s) in continuity relationships with patient(s) in practices that deliver first-contact, comprehensive, integrated, coordinated, high-quality and affordable care.* • *Curriculum should include training in communication skills with patients, families and fellow professionals.*	• *PC, P, SBP* • *IC, P*

Physician-directed medical practice. The personal physician leads a team of individuals at the practice level who collectively take responsibility for the ongoing care of patients.	• *Collaborative care*
	   – *All team members are accountable for their roles and responsibilities in delivering high-quality care*
	   – *All team members demonstrate respect for all other team members*
	 • *Team building*
	 • *Leadership skills*
	 • *Change and conflict management*
		• *Students should experience interdisciplinary teams (i.e. nurses, social workers, case managers, mental health professionals, diabetes educators, community partners and/or pharmacists)*
		 • *Students should be able to articulate the roles, functions and working relationships of all other members of the team.*
		 • *Curriculum should include experiences in leadership development, quality improvement, and change management.*
			• *SBP, IC, P, PC*
			
			 • *SBP, P*
			
			 • *P, PBL*

Whole-person orientation. The personal physician is responsible for providing for all the patient's	• *Life cycle knowledge/appreciation* • *Patient engagement /motivational interviewing*	• *Students should be taught to assess patient/family readiness to engage in health behavior change, to promote patient self-efficacy, and to facilitate health behavior change.*	• *MK, IC,*

health care needs or taking responsibility for appropriately arranging care with other qualified professionals. This includes for all stages of life: acute care; chronic care; preventive services; and end-of-life care.	• *Promotion of patient self-efficacy* • *Promotion of shared decision-making* • *Transitions of care* • *Promotion of health and wellbeing* • *Assessment of and respect for cultural values and practices* • *Assessment of health literacy*	• *Students should be exposed to health coaches and care coordinators who care for patients with complex conditions.* • *Students should have opportunities to elicit from patients and/or their families their cultural, spiritual, and ethnic values and practices.* • *Students should be taught how to assess and accommodate to diverse levels of health literacy.*	• *MK, SBL, IC, P* • *MK, PC* • *MK, PC, IC*
Care is coordinated and/or integrated across all elements of the complex health system (e.g. subspecialty care, hospitals, home health agencies, nursing homes) and the patient's community (e.g. family, public and private community based services). Care is facilitated by registries, information technology, health information exchange and other means to assure that patients get the indicated care when and where they need and want it in a culturally and linguistically appropriate manner.	• *Effective transitions of care* • *Knowledge of community resources and working with non-physician partners* • *Use of EMRs/HIT at points of care* • *Registry use* • *Population health* • *Coordination/collaboration with specialists, co-management of care over time* • *The value of patient advocacy*	• *Students should be exposed to the economics of health care systems across a community, including all settings of care.* • *Students should learn the relationship between payment models and health care delivery models.* • *Students should learn the basics of medical informatics and the technologies that support care and population management..* • *Students should be exposed to electronic health records, e-visits, e-prescribing and electronic billing.* • *Students should be taught principles of population health, including how patient registries can be used to manage population health.* • *Students should be taught principles of patient safety.* • *Students should be able to assess and recommend solutions to address patient risk during transitions of care, including use of tools such as care plans.*	• *SBP* • SBP • *MK, PBL* • *PBL, SBP* • *MK, SBP* • *PBL, MK* • *PBL, MK*
Quality and safety are hallmarks of the medical home: • Advocacy for attainment of optimal, patient centered outcomes defined by collaborative care planning process • Evidence based medicine and clinical decision support tools guide decision making • Physicians accept accountability for quality improvement (QI) through voluntary engagement in performance measurement and improvement • Patients actively participate in decision making and patient feedback is sought to assure expectations are being met • HIT is used to support optimal patient care performance measurement, patient education and enhanced communication	• *Use of point-of-care evidence based clinical decision support* • *Interpretation of quality reports* • *Knowing principles of performance improvement, measurement and how to use information to make decisions within practice* • *Patient and family engagement* • *Self-assessment of one's own performance* • *Knowledge of the principles of community health assessment* • *Patient and family advocacy skills*	• *Students should participate in teams within practices as they develop a culture of learning to improve the care process and patient experience.* • *Students should learn how health care is operationalized outside of the hospital setting.* • *Students should participate in multi-disciplinary patient safety training experiences.* • *Students should have opportunities to review quality data and recommend evidence-based systems changes to respond to performance assessment.*	• *SBP, PBL* • *SBP* • *PBL, P, MK* • *PBL*

• Practices go through a voluntary recognition process to demonstrate that they have PCMH capabilities • Patients and families participate in quality improvement activities at the practice level			
Enhanced Access to care is available through systems such as open scheduling, extended hours, and new options for communications between patients, their personal physician and practice staff	• *Understanding of rationale and principles of enhanced access* • *Phone medicine* • *Electronic communication* • *Group Visits* • *Visits with non-physician providers* • *Care outside of the location of the physical practice*	• *Students should experience a variety of different encounter types provided by other team members (e.g. shadowing experiences with pharmacists, nurses, social workers, schedulers and receptionists)* • *Students should experience a variety of different encounter types such as face-to-face, telephone and electronic messaging, and group visits*	• *PC, IC* • *PC, IC*
Payment appropriately recognizes the added value provided to patients who have a PCMH • Recognizes and values work that is done outside of face-to-face visit • Pays for care coordination, ancillary providers and community resources • Supports adoption of HIT for QI • Supports provision of e-communication • Recognizes values of physician work associated with remote monitoring of clinical data using technology • Maintains FFS • Recognizes case mix differences • Allows shared savings from reduced hospitalizations • Allows for quality bonus or incentive payments for measurable improvement	• *Knowledge of elements of population-based care, non-visit work and appreciation of value of these aspects of care* • *Understanding of enhanced payment opportunities* • *Understanding and application of the principles of advocacy*	• *Students should receive well-balanced instruction on physician payment methodologies that is encompassing of past, current and future policies.* • *Students should be informed of the public and private policy development processes that establish and/or influence coverage and payment determinations. It is desirable that students learn how they, as future physicians, can effectively advance those policies that are in the best interests of their patients and the nation's health care system.* • *Students should be familiar with current data on the overall cost of health care. This should include an understanding of the proportion of health care dollars spent on various segments of the health care system, those costs incurred by patients, as well as the overall costs of health care for employers and the government, and to the extent known, the relationship between costs and quality of care..*	• *MK* • *MK, SBP* • *MK, SBP*

326

327 *** Prerequisite to training: Faculty development is a current **unmet need** of this generation of faculty members, with respect to how to teach

328 medical students and residents about the PCMH – this needs attention.
