
Indications for Intrapartum GBS Prophylaxis

Vaginal and rectal cultures collected at 35 to 37 weeks' gestation for all pregnant women (unless patient had GBS bacteriuria during the current pregnancy or had a previous infant with invasive GBS disease)

Online figure A. Algorithm for the prophylaxis of GBS during labor. (GBS = group B streptococcus.)

*— If amnionitis is suspected, broad-spectrum antibiotic therapy that includes an agent known to be active against GBS should replace GBS prophylaxis.
