

Video: Woods maneuver—Shoulder Dystocia: Managing an Obstetric Emergency.mp4

Speaker 1: [00:00:00] To perform the Woods Screw Rotational maneuver, the obstetrics clinician will first put two to three fingers on the posterior, or backside, of the anterior fetal shoulder, as demonstrated. The next portion of the procedure is to put two to three fingers on the interior, or front side, of the posterior fetal shoulder and then rotate the baby 180 degrees. Once the rotation has been completed, the baby should deliver.
