Nutrition

This document is endorsed by the American Academy of Family Physicians (AAFP).

Introduction

This Curriculum Guideline defines a recommended training strategy for family medicine residents. Attitudes, behaviors, knowledge, and skills that are critical to family medicine should be attained through longitudinal experience that promotes educational competencies defined by the Accreditation Council for Graduate Medical Education (ACGME), www.acgme.org. The family medicine curriculum must include structured experience in several specified areas. Much of the resident’s knowledge will be gained by caring for ambulatory patients who visit the family medicine center, although additional experience gained in various other settings (e.g., an inpatient setting, a patient’s home, a long-term care facility, the emergency department, the community) is critical for well-rounded residency training. The residents should be able to develop a skillset and apply their skills appropriately to all patient care settings.

Structured didactic lectures, conferences, journal clubs, and workshops must be included in the curriculum to supplement experiential learning, with an emphasis on outcomes-oriented, evidence-based studies that delineate common diseases affecting patients of all ages. Patient-centered care, and targeted techniques of health promotion and disease prevention are hallmarks of family medicine and should be integrated in all settings. Appropriate referral patterns, transitions of care, and the provision of cost-effective care should also be part of the curriculum.

Program requirements specific to family medicine residencies may be found on the ACGME website. Current AAFP Curriculum Guidelines may be found online at www.aafp.org/cg. These guidelines are periodically updated and endorsed by the AAFP and, in many instances, other specialty societies, as indicated on each guideline.
Please note that the term “manage” occurs frequently in AAFP Curriculum Guidelines. “Manage” is used in a broad sense to indicate that the family physician takes responsibility for ensuring that optimal, complete care is provided to the patient. This does not necessarily mean that all aspects of care need to be directly delivered personally by the family physician. Management may include appropriate referral to other health care providers, including other specialists, for evaluation and treatment.

Each residency program is responsible for its own curriculum. This guideline provides a useful strategy to help residency programs form their curricula for educating family physicians.

Preamble

Nutrition plays a major role in the treatment of existing diseases, as well as health promotion and disease prevention. There is increasing direct evidence that links health and disease to diet. Nutritional guidelines are important components of the treatment plans for medical, surgical, and psychiatric conditions. Nutrition-related diseases such as coronary artery disease, stroke, hypertension, diabetes, and cancer are the leading causes of morbidity and mortality in the United States. Healthy People 2020 is a government initiative that involves the National Institutes of Health (NIH), the Centers for Disease Control and Prevention (CDC), the U.S. Food & Drug Administration (FDA), and the Centers for Medicare & Medicaid Services (CMS). It aims to increase the quality and years of healthy life and eliminate health disparities among different areas of the population. Four of the 26 Healthy People 2020 Leading Health Indicators (objective measures of the nation’s health status) directly measure exercise capabilities, obesity levels, and vegetable intake, while 22 objectives address nutrition and weight status indicators for the United States. A healthy diet can contribute to the prevention of many diseases and can form an essential part of the treatment plan for many chronic conditions. As patients are increasingly bombarded with nutrition advice from multiple sources, they rely on their physicians to help them evaluate the quality of popular nutrition, diet, and supplement claims. Physicians should develop the skills necessary to assess nutritional status and provide longitudinal information on diet and nutrition.

Competencies

At the completion of residency training, a family medicine resident should be able to:

- Understand general principles of nutrition, including its role in the prevention and management of specific diseases, and translate these principles into a plan of care for the patient (Patient Care, Medical Knowledge)
- Perform a comprehensive nutritional assessment including: 1) medical, social, and diet histories; 2) physical examination; 3) anthropometrics (i.e., height, weight, body mass index [BMI], head circumference, and body fat distribution [waist]
circumference and waist-to-hip ratios); and 4) appropriate laboratory tests (Patient Care, Medical Knowledge)

- Counsel patients regarding nutritional recommendations in a culturally sensitive manner (Professionalism, Interpersonal and Communication Skills)
- Use an evidence-based approach to assess the patient’s nutritional status and determine the effectiveness of interventions (Practice-based Learning and Improvement)
- Recognize patients who are at high risk for nutrition-related complications and refer them to nutrition consultants who can provide counseling and education (Patient Care, Medical Knowledge, Systems-based Practice)
- Recognize his or her own nutritional biases and make attempts to compensate for possible effects on patient care (Professionalism)

Attitudes and Behaviors

The resident should demonstrate attitudes and behaviors that encompass:

- Recognition that nutrition is an integral part of:
  a. Health promotion and disease prevention: Nutrition counseling that targets dietary risk factors as primary prevention has the potential to significantly reduce mortality and morbidity throughout the life cycle.
  b. Medical treatment of disease: Nutritional interventions have the potential to impact and cure certain disease processes. Additionally, proper nutritional status can help patients respond positively to medical interventions.

- Recognition that dietary intake is influenced by a variety of patient factors, including:
  a. Culture (family, community, ethnicity, and religion)
  b. Socioeconomic situation (ability to make independent food choices; ability to purchase, store, and prepare food)
  c. Psychosocial and mental health (e.g., depression, anorexia, dementia, bulimia, binge eating)
  d. Knowledge and bias (including educational level, reading ability, and preconceived ideas)
  e. General health and lifestyle (comorbid conditions, diseases, and habits)
  f. Policy (access to and availability of safe and healthy food choices, regional variability in food cost, and availability of low-income subsidy programs)

- Awareness that nutrition consultants should be utilized when appropriate to help provide counseling and education for at-risk patients. Nutritionists, registered dietitians, and licensed dietitians have specialized training in public health nutrition,
wellness, disease prevention, medical nutrition therapy, and nutrition education and counseling for individuals.

**Knowledge**

In the appropriate setting, the resident should demonstrate the ability to apply knowledge of the following:

1. General principles of nutrition, including:
   a. The roles of macronutrients and micronutrients: carbohydrates, fats, proteins, vitamins, minerals, water, and fiber
   b. Dietary reference intakes
   c. Nutritional content of foods
   d. Dietary recommendations (e.g., Dietary Guidelines for Americans, MyPlate Food Guide, Dietary Approaches to Stop Hypertension [DASH] diet, Life’s Simple 7 diet, Therapeutic Lifestyle Changes [TLC] diet)
   e. Vegetarian, flexitarian, and vegan diets (understanding the benefits and nutritional issues throughout the life cycle)
   f. Rationale for including more whole foods and fewer processed foods in the daily diet

2. Nutritional assessment
   a. Medical and social history, physical examination
   b. Anthropometrics (i.e., height, weight, BMI, head circumference, and body fat distribution [waist circumference and waist-to-hip ratios])
   c. Ordering and evaluating laboratory tests (inpatient and outpatient)

3. Nutritional issues for specific populations, including:
   a. Infants (e.g., breastfeeding, formula, addition of solids, allergy prevention, iron)
   b. Children (e.g., picky eating, pica, snacks, calcium, vitamins)
   c. Adolescents (e.g., recommended daily caloric intake, healthy choices, eating disorders, minerals, vitamins [including vitamin D])
   d. Adults (e.g., portion size, recommended daily caloric intake, habits, convenience foods, energy balance, calcium, vitamin D)
   e. Pregnancy (e.g., weight gain, recommended daily caloric intake, folic acid, iron, vitamins and minerals, vitamin D)
   f. Lactation (e.g., nutritional needs, recommended daily caloric intake, support, counseling, vitamin D)
g. Elderly (e.g., psychosocial issues, comorbid conditions, swallowing disorders, malabsorption syndromes, iatrogenic factors, vitamin D)

h. Athletes (e.g., eating disorders, overtraining, energy balance, supplements)

4. The role of nutrition in the management of symptomatology associated with the following specific diseases:

(Note: For several of the diseases listed, there is epidemiological or associative evidence for a role of nutrition, although direct evidence for primary prevention and treatment has not yet been established.)

a. Cancer

b. Cardiovascular disorders
   i. Coronary heart disease
   ii. Dyslipidemias
   iii. Hypertension
   iv. Congestive heart disease

c. Dental disease

d. Endocrine disorders
   i. Diabetes (type 1 and type 2)
   ii. Hypothyroidism
   iii. Hyperthyroidism
   iv. Obesity

e. Gastrointestinal disorders
   i. Gastroesophageal reflux disease
   ii. Gastritis and peptic ulcer disease
   iii. Infantile colic
   iv. Constipation
   v. Diverticular disease
   vi. Irritable bowel syndrome
   vii. Inflammatory bowel disease
   viii. Fatty liver disease
   ix. Hepatitis and cirrhosis
   x. Cholelithiasis
   xi. Pancreatitis
   xii. Chronic (noninfectious) diarrhea
   xiii. Bile acid and other forms of malabsorption
   xiv. Celiac disease
   xv. Lactose intolerance

f. Hematologic disorders
   i. Iron deficiency anemia
   ii. Megaloblastic anemia
   iii. Pernicious anemia
   iv. Sickle cell disease
g. Renal disorders
   i. Chronic kidney disease
   ii. Nephrolithiasis
   iii. Urinary tract infection
   iv. Nephrotic syndrome

h. Respiratory disorders
   i. Asthma
   ii. Chronic obstructive pulmonary disease
   iii. Cystic fibrosis

i. Bone and rheumatic disorders
   i. Osteoporosis
   ii. Gout

j. Neurologic disorders
   i. Migraine headache
   ii. Stroke

k. Skin conditions
   i. Acne vulgaris
   ii. Psoriasis
   iii. Atopic dermatitis

l. Gynecologic disorders
   i. Dysmenorrhea
   ii. Polycystic ovarian disease
   iii. Menopausal symptoms

5. Secondary malnutrition caused by systemic diseases, including:
   a. Alcoholism
   b. Cancer
   c. HIV/AIDS
   d. Malabsorption
   e. Pulmonary disease
   f. Food allergies
   g. Mood and psychiatric disorders

6. Weight loss strategies and counseling
   a. Behavior modification and goal setting
   b. Diet drugs (prescription, herbal, and over-the-counter)
   c. Popular diets and supplements
   d. Surgical approaches, including care and recommended monitoring of the patient prior to and after weight loss surgery
7. Disordered eating
   a. Anorexia nervosa
   b. Binge eating
   c. Bulimia nervosa

8. Use of dietary supplements, including:
   a. Vitamin and mineral deficiency, toxicity, and recommended intakes, including
      supplement interactions (e.g., calcium and iron)
   b. Guidelines for herbal, alternative, and other supplements, including drug
      interactions, safety, and efficacy
   c. Evidence-based nutrition resources and unproven nutritional supplement claims

9. Prevention, recognition, and treatment of food-borne illness

10. Allergies and food intolerances, including celiac disease, nonceliac gluten sensitivity,
    and at least minimal familiarity with the FODMAPs (Fermentable Oligosaccharides,
    Disaccharides, Monosaccharides, And Polyols) approach to assessment and
    management of irritable bowel syndrome

11. Physical activity and sports
    a. Recommendations for health and weight gain or loss
    b. Nutritional needs for various levels of activity (e.g., elite athletes) and for different
       age groups
    c. Hydration
       i. Overhydration and hyponatremia
       ii. Dehydration and electrolyte disorders/replacement

12. Enteral and parenteral nutrition
    a. Considerations for critical care patients
    b. Considerations for hospice and palliative care patients

13. Community nutrition resources (e.g., food bank; Meals on Wheels; Special
    Supplemental Nutrition Program for Women, Infants, and Children (WIC); school
    lunch programs)

14. Awareness of the issues surrounding the food industry as these issues impact
    patients’ ability to determine the nutritional content and availability of healthy foods

15. Basic understanding of the composition of a typical “Western diet” and how this
    deviates from an optimal dietary pattern
16. Understanding of the impact of the built environment on patients’ physical activity and access to nutritious foods (e.g., grocery stores and farmers’ markets versus “food deserts”; sidewalks, parks, and safe recreational areas)

Skills

In the appropriate setting, the resident should demonstrate the ability to independently perform or appropriately refer the following:

1. Integrating nutrition assessment and intervention into the medical history, review of systems, physical examination, laboratory evaluation, and plan of care

2. Assessing nutritional status and providing dietary recommendations for outpatients

3. Assessing nutritional status and writing diet prescriptions for inpatients (e.g., in hospitals, nursing homes, and other supervised living situations)

4. Ordering and interpreting appropriate laboratory and metabolic studies related to nutritional assessment and depletion

5. Evaluating results of lab data to determine patients’ progress on nutrition goals

6. Ordering and managing oral supplements and tube feeding, and understanding when and how to order and monitor total parenteral nutrition

7. Counseling patients and family members about specific nutritional needs related to stages of the life cycle, lifestyle, habits, disease prevention, and/or treatment of disease

8. Counseling patients on safe lifestyle approaches to weight management and how to balance caloric intake and physical activity

9. Assessing patients’ readiness to change behavior and motivating them to reach the next step

10. Monitoring patients’ progress with nutritional behavioral interventions, providing appropriate feedback, and guiding patients toward solutions to overcome obstacles

11. Personalizing nutrition recommendations based on cultural norms (e.g., Ramadan) and health status

12. Advising patients about the appropriate use of vitamin, mineral, probiotic, and other dietary and botanical supplements, and prescribing these supplements, when needed
13. Identifying diets and their associated nutritional risks and benefits (e.g., South Beach Diet, Atkins Diet, Paleo Diet, intermittent fasting, religious fasting, Mediterranean Diet, DASH diet, plant-based diets)

14. Developing strategies to teach patients how to identify and avoid overly processed foods and how to choose whole foods over processed ones

15. Answering patients’ questions about nutrition and its role in disease prevention in a culturally competent way that takes patients’ health literacy into account

16. Collaborating with nutritionists, registered dietitians, and licensed dietitians

17. Referring patients to reliable community nutrition resources (including websites)

**Implementation**

This curriculum should be taught during both focused and longitudinal experiences. It should be integrated into patient care, didactic conferences, and experiential learning activities. Nutritional status of the patient should be an integral part of case presentation, staffing, rounds, and other clinical activities in the inpatient and outpatient settings. Qualified nutrition professionals should teach nutrition, mentor residents, and be part of interdisciplinary team-based activities such as group patient education. Family medicine faculty should model and teach nutrition, as well as demonstrating practical and relevant ways to integrate nutritional information into patient care.
