on **VACCINATION 4 TEENS**

From Heartbreak to Hero

My daughter, Becky, was a vivacious, beautiful, fun-loving 20-year old who had a full life in front of her. She was an everyday kid, and I was an everyday dad. She played volleyball, drove her Honda Civic, hung out with friends, “borrowed” money from mom and dad, brought home boyfriends, and absolutely loved her dog, Rocky. We were close. Not a day goes by where I don’t think about our Becky.

It’s been 14 years since we lost Becky to a vaccine-preventable disease called meningococcal disease, otherwise known as bacterial meningitis. One day Becky was vibrant, coming home from visiting her friends at school, and the next day she was deathly ill. Becky died in less than 36 hours after showing symptoms of the flu. Our loss might have been prevented had we known about a vaccine that helps protect teens against meningitis.

“One day Becky was vibrant, coming home from visiting her friends at school, and the next day she was deathly ill.”

After Becky’s death, my wife Dee Dee and I have made it our mission, in honor of our daughter, to educate other parents, teens, physicians, nurses, teachers, and policymakers about the importance of vaccination. This has been my mission and my cause for over ten years, all because it’s what Becky would have wanted.

Becky is the hero in this story.

If we can save just one life, then we’ve made a difference.
