Vaccine boosters are common and maximize protection for people at high risk of severe illness.

Hospitalization rates are 9-15 times higher for unvaccinated individuals.

Vaccine boosters are common and maximize protection for people at high risk of severe illness.

Booster doses support vaccinated people at higher risk for COVID-19 complications.

All 3 COVID-19 vaccines can be used for booster doses.

mRNA booster: 6 months from final dose

2 months

J&J booster: 2 months from initial dose

It's ok to mix and match: Boosters can be different than original vaccine.

Getting vaccinated is still the best way to prevent severe disease and death from COVID-19.
