**Abstract**

Continuity of care is regarded as a tenant of primary care; particularly family medicine. It is positively affects patient satisfaction in the outpatient setting, and is increasingly surveyed and documented. In the obstetric literature, patient satisfaction is correlated with sense of patient control over the delivery and birthing process, but there is limited, if any, research on continuity of provider for prenatal care and delivery and patient satisfaction. Given that this is such an important part of family medicine obstetrics, we wish to better understand these relationships.
