

## Background

In the United States, primary care physicians (PCPs) currently represent less than one-third of the total physician workforce.<sup>1</sup> States are under increasing pressure to create solutions that bolster the number of physicians practicing primary care in both rural and urban settings.<sup>2</sup> This factsheet characterizes the primary care physician workforce in Missouri.

We used data mainly from the 2018 American Medical Association (AMA) Physician Masterfile. Physicians were classified as primary care if their primary specialty is family medicine, internal medicine, pediatrics, general practice or geriatrics. We restricted our counts to PCPs in direct patient care. With Centers for Medicare and Medicaid Services data, we identified PCPs that work mainly as hospitalists and excluded them from our analysis. Finally, we used additional data sources to identify osteopaths excluded from the AMA Masterfile.

## Current Workforce

In 2018, Missouri had 3,716 PCPs in direct patient care, of which 1,548 were family physicians. In other words, 42% of its primary care workforce consisted of family physicians, compared to 44% in the West North Central Census Division and 38% nationwide. On a per capita basis, there were about 61 PCPs per 100,000 persons in Missouri, compared to 77 per 100,000 in the West North Central and 76 per 100,000 in the U.S. as a whole. The state's family medicine workforce was 43% female, which was less than the percentage nationwide (45%). Consistent with national trends, younger family physicians were more likely to be female than their older counterparts. About 44% of family physicians were over the age of 55, equal to the nationwide percentage of 44%.

Age Distribution of Family Physicians, by Gender

Distribution of Primary Care Physicians, by Specialty

	Missouri	West North Central*	Nation
<b>Characteristics of Family Physicians and PCPs</b>			
Percent over 55 Years (PCP)	44	42	44
Percent Female (FP)	43	45	45
Percent Osteopaths (FP)	22	15	12
Percent International Medical School Graduates (FP)	8	7	12
<b>Distribution of PCPs</b>			
Percent Total State Population Rural	25	31	14
Percent Family Physicians Rural	26	28	14
Percent Total State Population in Underserved County**	34	22	18

\*US Census Bureau West North Central Census Division States: IA, KS, MN, MO, NE, ND, SD

\*\*Underserved counties had a population to PCP ratio greater than 2,000:1.

In 2018, about 8% of family physicians in the state were international medical school graduates and 22% were trained as osteopaths. While 25% of Missouri’s population lived in rural counties, 26% of family physicians work in these counties. Approximately 34% of Missouri’s residents live in underserved counties with more than 2,000 persons per PCP.

### Future Workforce

Evidence indicates that physicians are more likely to practice in the state in which they completed residency.<sup>3</sup> National PCP deficits have stimulated the growth of in-state residency programs to replenish the aging generation of physicians leaving the workforce. Understanding current primary care residency programs can help Missouri assess its future primary care workforce to meet the health care needs of its population.

There are 8 family medicine residency training programs in Missouri. Nationally, the number of family physicians graduating from the Accreditation Council for Graduate Medical Education-accredited programs declined from 3,225 in 2005 to 2,970 in 2012, then increased to 3,383 by 2017. Trends for Missouri over the same period are shown in the adjacent figure.

Between 2011 and 2017, the state produced a total of 445 family physicians; of these, 189 (42%) stayed in-state. The loss of state-trained family physicians is offset by the in-migration of 113 family physicians trained in other states. Through elevated support of family medicine residency programs, Missouri can work to replenish the PCP pipeline practicing in local communities.
